## Hot Weather Planting

WILL PRODUCE A TEMPORARY LAWN  
WITHIN TWO WEEKS

---

---

We offer a special mixture of fast growing grasses — Domestic and Perennial Ryegrass and Red Top — which not only provides a temporary green cover for bare spots until a permanent lawn can be seeded in the Fall, but also benefits the soil by adding organic matter and prevents weeds from developing.

To the Trade:

Why let unsightly bare spots exist and weeds develop during the summer months?

According to N. J. Agricultural Experiment Station bulletin 724 (page 32) Ryegrass and Red Top will form a green temporary covering within 2 weeks. These grasses can be sown any time during the hot weather. They will persist until the Fall when they can be spaded or plowed under and a permanent lawn seeded.

By using our special mixture described on the reverse side, you will not only have a beautiful temporary lawn, but you will also be laying the groundwork for a permanent turf in the Fall.
